Shortcuts & how AIRIS works

Everything in AIRIS is reachable from the floating drawer — the shortcuts below are optional accelerators. This sheet is also saved as a softcopy in `SHORTCUTS.md` at the project root.

⌨ GLOBAL SHORTCUTS

KEYS	WHAT IT DOES
`Ctrl` + `Shift` + `Z`	Open or close the AIRIS drawer. The drawer also auto-closes after a few seconds.
`Ctrl` + `Shift` + `N`	Wink — the on-screen eyes blink once as a visual acknowledgment.
`Ctrl` + `Shift` + `H`	Open this Shortcuts & Help sheet from anywhere.
`Esc`	Close the focused AIRIS window (Settings, Help, Chatbot, Terminal, popup).

Tip: the eyes at the top of the screen follow your mouse and blink on their own — that is the assistant idling. Messages appear in the bottom-right; hover one to pause its timer and scroll or copy long answers.

🧠 DRAWER ACTIONS

Hover the 🧠 **Start** trigger in the bottom-left corner (or press `Ctrl` + `Shift` + `Z`) to open the drawer.

ACTION	WHAT IT DOES
Highlight & Explain	Select text in any app, then choose this — AIRIS copies the selection, opens a popup at your cursor and explains it.
Patch Content	Select code, then choose this — AIRIS cuts it, reviews the bug, generates a fix and pastes the corrected code back in place.
Chatbot	Toggles the floating chat window. `Enter` sends, `Shift` + `Enter` adds a new line.
Terminal	Toggles the AIRIS terminal. Type a natural-language instruction, press `Enter`, and the generated command runs.
Screen Capture	Captures the screen and shows the AI's analysis (the same engine as the periodic screen roast).
YouTube Summary	Downloads audio for the configured video, transcribes it and shows a summary.
NEURALIS	Opens the email/assistant window. `Enter` sends, `Shift` + `Enter` adds a line, the mic button toggles speech.
Shortcuts & Help	Opens this sheet.
⚙ AI Settings	Provider, endpoint URL, model and request options — one configuration shared by every feature.

🖱️ TRAY MENU

Right-click the AIRIS icon in the system tray: **Show App**, **AI Settings**, **Shortcuts & Help**, **Quit**.

🔌 CONNECTING LM STUDIO (URL ONLY)

1. In **LM Studio**, load a model, open the **Developer** tab and click **Start Server** (default `http://localhost:1234`).
2. In AIRIS, open **drawer** → ⚙️ **AI Settings**.
3. Set **Provider** to *LM Studio (local)* and keep the base URL `http://localhost:1234/v1`.
4. Leave the model on ✨ **Auto** — AIRIS uses whichever model LM Studio has loaded.
5. Click 🔌 **Test Connection**, then 💾 **Save Settings**. Done.

> Any OpenAI-compatible server works the same way: paste its base URL (usually ending in `/v1`) and leave the model on Auto. AIRIS calls `GET {url}/models` to discover a model and `POST {url}/chat/completions` for chat.

Screen analysis needs vision: load a multimodal model in LM Studio and set it under *AI Settings → Advanced → Vision model*. Text models can still do chat, patching and summaries.

🩺 QUICK TROUBLESHOOTING

SYMPTOM	FIX
Connection refused	The AI server is not running, or the port is wrong. Start the LM Studio server and check the URL.
HTTP 404	The base URL is missing the version path — it should normally end in `/v1`.
First reply is slow	LM Studio loads the model on the first request. Subsequent messages are faster.
No model loaded	Load a model in LM Studio, or open AI Settings → Refresh Models and pick one explicitly.
Empty response / cut off	Raise *Advanced → Max tokens per request*, especially for reasoning models.
Vision call fails	The selected model has no image support. Load a vision model and set it as the Vision model.
